

Amazon Web Services (AWS)

A Complete 4-Month Industry-Ready Online Course

Designed for early professionals, graduate students, and career transitioners ready to master cloud computing and launch careers in one of today's most in-demand technical domains.

■ 4 MONTHS · 15–16 WEEKS

■ BEGINNER TO JOB-READY

■ AWS CERTIFIED PATH

WHY THIS COURSE

Why AWS Skills Matter in Today's Industry

Cloud computing is no longer optional — it is the foundation of modern enterprise infrastructure. AWS commands over **31% of the global cloud market**, making it the industry standard across startups, Fortune 500s, and government agencies alike. Organizations are rapidly migrating workloads to the cloud, and the demand for skilled AWS professionals far outpaces supply.

Whether you are building applications, managing infrastructure, or analyzing data, AWS fluency is now a baseline expectation in nearly every technical role. This course bridges the gap between academic knowledge and the real-world cloud skills employers are actively hiring for.

The Market Opportunity

\$1.3 Trillion

Global cloud market value by 2025

500K+ Jobs

Open AWS-related roles globally

30–40% Premium

Salary advantage for AWS-certified professionals

Program Structure at a Glance

This course is structured in four deliberate phases that progressively build your AWS expertise — from foundational cloud literacy to advanced architecture and a capstone project that mirrors real workplace scenarios.

Foundation Phase

Weeks 1–4: Cloud fundamentals, core AWS services, IAM, EC2, S3

Intermediate Phase

Weeks 5–8: Networking, databases, serverless, monitoring

Advanced Phase

Weeks 9–12: Architecture, DevOps, ML services, security

Capstone Project

Weeks 13–16: End-to-end solution design and live demo

Weekly Format

- Weekend recorded session — concept-focused, self-paced
- Weekend live 1:1 or small-group mentoring — doubt clearing and case discussions
- Hands-on lab exercises on AWS Free Tier

Content Breakdown

- 70–80% core AWS concepts and fundamentals
- 10–15% industry use cases and real-world applications
- 10% assessments, projects, and career guidance

Tools & Technology Stack

You will work with the same tools used by cloud engineers and architects in production environments. No expensive licenses required — the AWS Free Tier covers the majority of exercises in this course.

Core Platform

- AWS Management Console
- AWS CLI (Command Line Interface)
- AWS CloudShell
- AWS Free Tier Account

IaC & Automation

- AWS CloudFormation
- Terraform (intro)
- AWS CDK (Cloud Dev Kit)
- Boto3 (Python SDK)

DevOps & CI/CD

- AWS CodePipeline
- AWS CodeBuild
- GitHub / GitHub Actions
- Docker (containerization)

Monitoring & Security

- AWS CloudWatch
- AWS CloudTrail
- AWS Config
- AWS IAM & Security Hub

Foundation Phase: Cloud Fundamentals & Core AWS Services

The foundation phase is designed to establish confident cloud literacy. By the end of Week 4, learners will understand how the cloud works, how AWS organizes its global infrastructure, and how to interact with the most critical core services hands-on.

Each week builds directly on the last, ensuring no concept is introduced in isolation. Labs are conducted on the AWS Free Tier so learners gain real console experience from Day 1.

Week 1: Cloud Computing & AWS Fundamentals

Learning Outcome: Understand cloud computing models, AWS global infrastructure, and navigate the AWS Console confidently.

Topics Covered

01

What is Cloud Computing?

IaaS, PaaS, SaaS models and when to use each

02

AWS Global Infrastructure

Regions, Availability Zones, Edge Locations explained

03

AWS Console & Account Setup

Billing alerts, Free Tier limits, MFA setup

04

Shared Responsibility Model

What AWS manages vs. what you manage

05

AWS Pricing Models

On-demand, Reserved, Spot Instances, Savings Plans

06

AWS Support Plans & SLAs

Developer, Business, Enterprise tiers compared

Week 1 Assignment

Create a personal AWS Free Tier account, enable MFA, set up a billing alarm at \$5, and explore 5 core AWS services in the console. Document your findings in a 1-page reflection.

Expected Outcomes

- Articulate cloud vs. on-premise trade-offs
- Navigate AWS Console without assistance
- Explain the Shared Responsibility Model
- Identify cost-effective pricing options

Week 2: Identity & Access Management (IAM)

Learning Outcome: Design and implement secure access controls using AWS IAM — a critical skill emphasized in every AWS certification and every production environment.

Topics Covered

01

IAM Users, Groups & Roles

Difference between identities and how to assign permissions

02

IAM Policies (JSON)

Writing inline vs. managed policies; Effect, Action, Resource

03

Principle of Least Privilege

Why over-permissioning is a top cloud security risk

04

IAM Roles for Services

Granting EC2, Lambda, and other services permission to act

05

Multi-Factor Authentication (MFA)

Enabling MFA for root and IAM users

06

AWS Organizations & SCPs

Managing multi-account environments with Service Control Policies

Practical Lab

Create three IAM users with different permission levels (ReadOnly, Developer, Admin). Attach managed and custom JSON policies. Assume a role using the CLI and test access boundaries.

Expected Outcomes

- Write and apply IAM policies in JSON
- Distinguish when to use users, groups, and roles
- Audit IAM permissions using IAM Access Analyzer
- Apply least-privilege principles in a team scenario

Week 3: Compute with Amazon EC2

Learning Outcome: Launch, configure, and manage EC2 instances — the backbone of AWS compute — and understand how to right-size and secure virtual machines for real workloads.

Topics Covered

01

EC2 Instance Types & Families

General purpose, compute-optimized, memory-optimized use cases

02

AMIs & Launch Templates

Creating, selecting, and customizing Amazon Machine Images

03

Security Groups & Key Pairs

Configuring firewall rules and SSH access for EC2

04

Elastic IPs & Instance Metadata

Static addressing and runtime metadata access

05

Auto Scaling Groups (ASG)

Horizontal scaling based on CloudWatch metrics

06

EC2 Pricing & Spot Instances

Cutting compute costs by up to 90% with Spot strategies

Mini Project

Deploy a web server on EC2 using a User Data script to install and start Apache on launch. Attach an Elastic IP, configure a security group allowing HTTP/HTTPS, and test the live endpoint in a browser.

Expected Outcomes

- Launch and connect to EC2 instances via SSH
- Configure security groups with proper rules
- Explain ASG scaling policies and triggers
- Estimate costs using the AWS Pricing Calculator

Week 4: Storage — Amazon S3, EBS & EFS

Learning Outcome: Select and implement the right AWS storage service for any use case, from object storage and block volumes to shared file systems.

Topics Covered

01

Amazon S3 Core Concepts

Buckets, objects, prefixes, versioning, and storage classes

02

S3 Security & Bucket Policies

ACLs, bucket policies, Block Public Access settings

03

S3 Lifecycle Rules & Glacier

Automating data archival and cost optimization

04

Amazon EBS Volumes

gp3 vs io2 vs st1 — choosing the right block storage

05

Amazon EFS (Elastic File System)

Shared NFS storage across multiple EC2 instances

06

AWS Storage Gateway & Snow Family

Hybrid and offline data transfer for large datasets

Practical Lab

Create an S3 bucket with versioning and lifecycle rules enabled. Host a static website on S3. Attach an EBS volume to an EC2 instance, format it, and mount it. Compare access patterns and costs across storage tiers.

Expected Outcomes

- Configure S3 buckets with security and versioning
- Select appropriate storage class for cost vs. access needs
- Attach and manage EBS volumes on EC2
- Host a functional static website on S3

Intermediate Phase: Networking, Databases & Serverless

The intermediate phase shifts from individual service mastery to integrating services into cohesive architectures. Learners will design VPCs, work with managed databases, build serverless applications, and implement robust monitoring — the skills that distinguish a cloud user from a cloud engineer.

Week 5

Networking & VPC — Design isolated, secure cloud networks

Week 6

Databases — RDS, DynamoDB, ElastiCache for managed data

Week 7

Serverless — Lambda, API Gateway, SQS, SNS event-driven apps

Week 8

Monitoring & Cost Optimization — CloudWatch, Trusted Advisor

- By the end of Week 8, learners should be able to independently design a 3-tier web application architecture on AWS — a benchmark used in cloud engineer interviews.

Week 5: Networking & Amazon VPC

Learning Outcome: Design and implement a secure, multi-tier Virtual Private Cloud network — the infrastructure backbone of every production AWS environment.

Topics Covered

01

VPC Architecture

CIDR blocks, subnets (public/private), route tables

02

Internet & NAT Gateways

Enabling outbound internet for private subnets securely

03

Security Groups vs. NACLs

Stateful vs. stateless traffic filtering — when to use each

04

VPC Peering & Transit Gateway

Connecting multiple VPCs across accounts and regions

05

Elastic Load Balancer (ALB/NLB)

Distributing traffic across instances and target groups

06

Route 53 DNS & Health Checks

Routing policies: simple, weighted, latency, failover

Mini Project

Build a VPC from scratch with public and private subnets across two Availability Zones. Place a web server in the public subnet behind an ALB, and a database in the private subnet. Validate connectivity and security group rules end-to-end.

Expected Outcomes

- Design a multi-AZ, multi-tier VPC architecture
- Explain the difference between NACLs and Security Groups
- Configure an ALB with target groups and health checks
- Set up Route 53 with a simple routing policy

Week 6: Managed Databases — RDS, DynamoDB & ElastiCache

Learning Outcome: Select and configure the right AWS database service — relational, NoSQL, or in-memory cache — for a given application requirement, a decision made daily by cloud engineers.

Topics Covered

01

Amazon RDS Deep Dive

MySQL, PostgreSQL, Multi-AZ deployment, Read Replicas

02

Amazon Aurora

5x faster than MySQL — serverless, auto-scaling, global clusters

03

Amazon DynamoDB

NoSQL fundamentals: partition keys, sort keys, GSIs, streams

04

DynamoDB Capacity Modes

On-demand vs. provisioned; auto-scaling and DAX caching

05

Amazon ElastiCache

Redis vs. Memcached for session management and caching

06

Database Migration Service (DMS)

Migrating on-premise databases to AWS with minimal downtime

Practical Lab

Launch an RDS MySQL instance in a private subnet. Connect from an EC2 bastion host. Create a DynamoDB table with a composite key and run query and scan operations. Compare response times with and without ElastiCache Redis caching.

Expected Outcomes

- Deploy RDS with Multi-AZ and Read Replicas enabled
- Model a DynamoDB schema for a real use case
- Choose between SQL and NoSQL based on access patterns
- Explain the performance impact of caching layers

Week 7: Serverless Architecture — Lambda, API Gateway & Messaging

Learning Outcome: Build event-driven, serverless applications using AWS Lambda and supporting services — one of the fastest-growing patterns in modern application development.

Topics Covered

01

AWS Lambda Deep Dive

Function anatomy, triggers, layers, concurrency, cold starts

02

Amazon API Gateway

Building REST and HTTP APIs connected to Lambda functions

03

Amazon SQS (Queue Service)

Standard vs. FIFO queues, visibility timeout, dead-letter queues

04

Amazon SNS (Notification Service)

Pub/Sub fan-out patterns, topic subscriptions, filtering

05

Amazon EventBridge

Event-driven architecture with rules, patterns, and routing

06

AWS Step Functions

Orchestrating multi-step Lambda workflows with state machines

Mini Project

Build a serverless REST API that accepts a POST request via API Gateway, triggers a Lambda function to process data, stores results in DynamoDB, and sends a notification via SNS upon completion. Deploy and test end-to-end using Postman or curl.

Expected Outcomes

- Write and deploy Python/Node.js Lambda functions
- Connect API Gateway to Lambda with proper auth
- Implement an SQS-triggered processing pipeline
- Design a basic event-driven microservice

Week 8: Monitoring, Logging & Cost Optimization

Learning Outcome: Instrument AWS environments with robust monitoring and implement cost governance strategies — essential skills for any professional managing cloud infrastructure responsibly.

Topics Covered

01

Amazon CloudWatch

Metrics, alarms, dashboards, log groups, Insights queries

02

AWS CloudTrail

API activity auditing and governance for compliance

03

AWS Config

Resource configuration tracking and compliance rules

04

AWS Cost Explorer & Budgets

Visualizing spend, forecasting, and setting budget alerts

05

AWS Trusted Advisor

Automated checks for cost, performance, security, and limits

06

Compute Optimizer & Rightsizing

ML-powered recommendations to reduce over-provisioning

Practical Lab

Create CloudWatch dashboards and custom metrics for an EC2-based application. Set alarms that trigger SNS notifications. Run CloudTrail logs through Athena to query API history. Use Cost Explorer to identify the top 3 cost drivers in a sample account.

Expected Outcomes

- Build operational dashboards with custom metrics
- Set up proactive alerting for key thresholds
- Conduct a cost audit and generate savings recommendations
- Use CloudTrail to investigate a simulated security event

Advanced & Application Phase: Architecture, DevOps & AI/ML

The advanced phase builds the architectural thinking and automation skills that separate cloud engineers from cloud architects. Learners will apply Well-Architected best practices, build CI/CD pipelines, work with containers, and explore AWS's AI and machine learning services.

WEEK 9: WELL-ARCHITECTED ARCHITECTED FRAMEWORK & HA DESIGN

Designing for High
Availability and fault
tolerance on AWS

WEEK 10: CONTAINERS (ECS, EKS, DOCKER)

Orchestrating containerized
applications with ECS and
Kubernetes

WEEK 11: DEVOPS & CI/CD AUTOMATION

Building continuous
delivery pipelines with
AWS developer tools

WEEK 12: AWS AI/ML SERVICES

WEEK 12: AWS AI/ML SERVICES & BEDROCK

Leveraging pre-trained
and custom ML models
for insights

Week 9: AWS Well-Architected Framework & High Availability

Learning Outcome: Apply the six pillars of the AWS Well-Architected Framework to evaluate and improve cloud architecture decisions — a framework used in real AWS customer reviews.

Topics Covered

01

The 6 Pillars

Operational Excellence, Security, Reliability, Performance, Cost, Sustainability

02

High Availability Patterns

Multi-AZ, multi-region, active-active vs. active-passive

03

Disaster Recovery Strategies

RTO/RPO goals: Backup & Restore, Pilot Light, Warm Standby

04

Amazon CloudFront & CDN

Global content delivery with edge caching and origins

05

AWS Global Accelerator

Routing end users to the optimal AWS endpoint globally

06

Architecture Review Lab

Using the AWS Well-Architected Tool to review a sample workload

Assignment

Review a provided 3-tier application architecture against the 6 pillars using the AWS Well-Architected Tool. Identify at least 3 risks per pillar and propose improvements. Present findings in a structured architecture review document.

Expected Outcomes

- Conduct a Well-Architected Review for a real workload
- Design for 99.99% availability using multi-AZ patterns
- Choose the appropriate DR strategy based on RTO/RPO
- Configure CloudFront with S3 and EC2 origins

Week 10: Containers on AWS — ECS, EKS & Docker

Learning Outcome: Containerize applications and deploy them on AWS managed container services — a skill now expected in virtually every cloud engineering and DevOps job description.

Topics Covered

01

Docker Fundamentals

Images, containers, Dockerfile, Docker Compose, ECR push

02

Amazon ECR (Container Registry)

Storing, versioning, and securing container images

03

Amazon ECS with Fargate

Serverless container orchestration — no EC2 management needed

04

Amazon EKS (Kubernetes)

Managed Kubernetes — deployments, services, ingress, Helm

05

Service Discovery & Scaling

ALB Ingress Controller, HPA, Cluster Autoscaler for EKS

06

Container Security Best Practices

ECR image scanning, IAM roles for tasks, network policies

Mini Project

Containerize a Python Flask API using Docker. Push the image to Amazon ECR. Deploy it using ECS with Fargate and expose it via an Application Load Balancer. Enable auto-scaling based on CPU utilization and test the scaling behavior under load.

Expected Outcomes

- Write a Dockerfile and build production-ready images
- Deploy containerized apps on ECS Fargate
- Configure ECS task definitions and services
- Explain Kubernetes core concepts relative to ECS

Week 11: DevOps on AWS — CI/CD & Infrastructure as Code

Learning Outcome: Build automated CI/CD pipelines and manage infrastructure as code — the practices that enable teams to deploy changes reliably, quickly, and safely in production.

Topics Covered

01

AWS CodeCommit & CodeBuild

Source control and automated build/test execution on AWS

02

AWS CodeDeploy & CodePipeline

Automated blue/green and rolling deployments to EC2/ECS

03

GitHub Actions with AWS

Integrating GitHub workflows with OIDC for secure AWS access

04

AWS CloudFormation

YAML/JSON templates, stacks, nested stacks, drift detection

05

Terraform on AWS (Intro)

Provider config, state management, modules, plan/apply workflow

06

AWS CDK (Cloud Development Kit)

Defining infrastructure using Python or TypeScript constructs

Mini Project

Build a complete CI/CD pipeline using GitHub Actions that, on each push: runs unit tests via CodeBuild, packages a Lambda function, deploys it via CloudFormation, and sends a Slack notification. Provision all infrastructure using a CloudFormation template.

Expected Outcomes

- Build a working CI/CD pipeline from source to deploy
- Write CloudFormation templates to provision AWS resources
- Apply IaC principles to eliminate manual console work
- Implement blue/green deployment for zero-downtime releases

Week 12: AI/ML Services & Advanced Security on AWS

Learning Outcome: Integrate AWS's managed AI/ML services into applications without needing a data science background, and implement enterprise-grade security practices for production environments.

AI/ML Topics

01

Amazon Rekognition

Image and video analysis — labels, faces, moderation

02

Amazon Comprehend & Textract

NLP, sentiment analysis, and document data extraction

03

Amazon Bedrock

Generative AI APIs — integrating foundation models into apps

04

Amazon SageMaker Intro

Training, deploying, and monitoring custom ML models

05

AWS Security Hub & GuardDuty

Unified security posture management and threat detection

06

AWS KMS, Secrets Manager & WAF

Encryption key management, secret rotation, and web protection

Lab

Build a document processing pipeline: upload a PDF to S3, trigger a Lambda function that calls Textract to extract text, passes it to Comprehend for sentiment analysis, stores results in DynamoDB, and optionally queries Amazon Bedrock for a summary. Secure all secrets using Secrets Manager.

Expected Outcomes

- Integrate 3+ AWS AI services into a working pipeline
- Enable GuardDuty and interpret threat findings
- Implement encryption at rest and in transit using KMS
- Protect a web application endpoint with AWS WAF rules

Industry Case: E-Commerce Platform Scaling on AWS

Business Problem

A mid-size e-commerce retailer experienced severe outages every Black Friday when traffic spiked 20x overnight. Their monolithic on-premise servers could not scale, resulting in lost revenue estimated at \$2M per incident. They needed an elastic, cost-efficient solution that could handle unpredictable demand spikes without over-provisioning year-round.

AWS Solution Applied

- **EC2 Auto Scaling Groups** with ALB for the application tier
- **Amazon Aurora** with Read Replicas to handle read-heavy traffic
- **Amazon ElastiCache (Redis)** for session and product catalog caching
- **Amazon CloudFront** to serve static assets from 300+ edge locations
- **S3 + Lambda** for order confirmation emails via SES

Business Impact

99.99% Uptime

Achieved during peak holiday events post-migration

65% Cost Reduction

By using Spot Instances for batch processing workloads

8-Minute Recovery

RTO achieved using multi-AZ and automated failover

Early Professional Role

Cloud Support Engineer — monitoring dashboards, tuning Auto Scaling policies, managing CloudWatch alarms, and documenting runbooks.

Industry Case: Healthcare Data Pipeline with Serverless AWS

Business Problem

A healthcare analytics company needed to ingest, process, and analyze millions of patient records daily from hospital systems. The data was sensitive (HIPAA-regulated), arrived in irregular bursts, and required real-time dashboards for clinical decision support. Maintaining dedicated servers was too costly and operationally complex for their 12-person engineering team.

AWS Solution Applied

- **Amazon Kinesis Data Streams** for real-time ingestion of HL7/FHIR records
- **AWS Lambda** for on-demand transformation and validation logic
- **Amazon S3 + Glue + Athena** for a serverless data lake and querying
- **Amazon QuickSight** for real-time clinical dashboards
- **AWS KMS + CloudTrail** for HIPAA-compliant encryption and audit logging

Business Impact

\$1.2M Saved

Annual infrastructure savings vs. on-premise data warehouse

Sub-30 Second

End-to-end pipeline latency from ingestion to dashboard

HIPAA Compliant

Full audit trail and encryption validated by external audit

Early Professional Role

Data/Cloud Engineer — building Lambda functions, writing Glue ETL jobs, monitoring Kinesis streams, and maintaining data quality checks in the pipeline.

Industry Case: GenAI-Powered Customer Support on AWS Bedrock

Business Problem

A SaaS company with 200,000+ users was spending \$3M annually on a customer support team that handled repetitive, tier-1 queries (password resets, billing questions, product how-tos). Response times averaged 6 hours. They needed an AI-first support experience that felt natural, reduced wait times to seconds, and seamlessly escalated complex cases to human agents.

AWS Solution Applied

- **Amazon Bedrock** with Claude model for conversational AI responses
- **Amazon Lex** for intent recognition and conversation orchestration
- **AWS Lambda** to retrieve customer data from DynamoDB in real time
- **Amazon Connect** for escalation routing to human agents
- **Amazon Comprehend** for sentiment detection and priority flagging

Business Impact

78% Deflection

Tier-1 tickets resolved by AI without human intervention

12-Second Avg

Response time vs. previous 6-hour average

\$1.8M Savings

Annual operational cost reduction in Year 1

Early Professional Role

ML/Cloud Engineer — fine-tuning Lex intents, writing Lambda resolvers, monitoring Bedrock API usage, and evaluating model response quality with A/B testing.

Capstone Project: Build a Production-Ready AWS Solution

The capstone is the culmination of everything learned across 12 weeks. Learners design, build, deploy, and present a complete cloud solution that solves a realistic business problem — demonstrating job-ready AWS skills to potential employers.

💡 Sample Project Ideas

- Multi-tier web app with auto-scaling, RDS, and CI/CD pipeline
- Serverless data pipeline for real-time analytics dashboard
- AI-powered document processing system using Bedrock + Textract
- Containerized microservices platform deployed on ECS Fargate

📄 Deliverables

- Architecture diagram (draw.io or AWS Architecture Icons)
- IaC code (CloudFormation or Terraform) in a GitHub repo
- 10-minute live demo with Q&A
- Cost estimation and optimization report

CAREER ALIGNMENT

Job Roles This Course Prepares You For

AWS skills are transferable across a wide range of job titles. The roles below represent the most common entry-points for learners who complete this program, organized by the primary skills leveraged from this course.

Cloud Engineer

Design, deploy, and manage AWS infrastructure. Core skills: EC2, VPC, IAM, CloudFormation, monitoring. Avg. salary: \$105K–\$135K.

DevOps / Cloud DevOps Engineer

Automate deployments with CI/CD pipelines, IaC, and containers. Core skills: CodePipeline, Terraform, ECS, GitHub Actions. Avg. salary: \$115K–\$145K.

Data Engineer (Cloud)

Build data pipelines and lakes on AWS. Core skills: S3, Glue, Kinesis, Athena, Lambda, DynamoDB. Avg. salary: \$110K–\$140K.

Cloud Security Engineer

Secure AWS environments and ensure compliance. Core skills: IAM, GuardDuty, Security Hub, KMS, WAF. Avg. salary: \$120K–\$155K.

Skills Mapping: Beginner → Intermediate → Job Ready

This course is deliberately structured to mirror the real skills progression that hiring managers look for when evaluating cloud candidates at different stages of readiness.

Beginner

Weeks 1–4

- AWS Console navigation
- IAM users, groups, policies
- EC2 launch & SSH access
- S3 bucket management
- Basic billing awareness
- Cloud vs. on-prem concepts

Intermediate

Weeks 5–8

- VPC design & networking
- RDS & DynamoDB management
- Lambda serverless functions
- CloudWatch monitoring
- Cost optimization strategies
- 3-tier architecture design

Advanced

Weeks 9–12

- Well-Architected Reviews
- Container orchestration (ECS/EKS)
- CI/CD pipeline automation
- AI/ML service integration
- Security hardening & compliance
- Multi-region architecture

Job Ready

Week 16

- End-to-end capstone project
- GitHub portfolio with IaC code
- Live demo presentation skills
- AWS Solutions Architect prep
- Industry case study fluency
- Peer-reviewed architecture docs

Your AWS Certification Roadmap After This Course

This course is intentionally aligned to the AWS certification framework, giving you a clear progression path for continued career advancement after completing the program. Each badge you earn multiplies your market value.

1

AWS Cloud Practitioner (CLF-C02)

Foundational – recommended after Weeks 1–4. Validates cloud literacy for all roles.

2

AWS Solutions Architect – Associate (SAA-C03)

Intermediate – recommended after Week 12. The most popular AWS cert globally. Validates architecture skills.

3

AWS Developer or SysOps – Associate

Specialized – choose based on your career path: Dev (serverless, CI/CD) or SysOps (operations, monitoring).

4

AWS Solutions Architect or DevOps – Professional

Advanced – pursue 12–18 months post-course with production experience. Commands top-tier salaries.

Key Takeaways from This Program

When you complete this course, you won't just know AWS — you'll be able to build real things, speak confidently about architecture decisions, and demonstrate hands-on skills that hiring managers can verify. Here's what sets this program apart:

Hands-On From Day 1

Every week includes a real lab or mini project on AWS Free Tier. You graduate with a portfolio of 10+ deployed projects, not just certificates of completion.

Industry-Calibrated Content

Content is mapped to what AWS cloud engineers, DevOps engineers, and data engineers actually do on the job — not just what's on a certification exam.

Live Mentoring Every Week

Weekly 1:1 or small-group mentoring sessions ensure you never get stuck alone. Real feedback accelerates learning faster than any self-paced platform.

Clear Career Destination

Skills are explicitly mapped to job roles and salaries. The capstone project becomes your first portfolio piece — a tangible artifact for job interviews.

AWS is not just a technology skill — it is a career accelerator. Cloud-certified professionals consistently earn 30–40% more than their non-certified peers in equivalent roles.

Your Roadmap After Completing This Course

Completing this program is not an endpoint — it is a launchpad. Here is a clear, practical roadmap for your first 12 months after graduating, designed to maximize your employability and career trajectory in cloud computing.
